Question: Suppose X is a binomial distribution $B\left(6, \frac{1}{2}\right)$. Show that $X = 3$ is the most likely outcome. (Hint : $P(X = 3)$ is the maximum among all $P(x_i), x_i = 0, 1, 2, 3, 4, 5, 6$)

Solution:

$$X \sim \text{Bin}\left(6, \frac{1}{2}\right) \quad (1)$$

Thus,

$$\Rightarrow \begin{cases} n = 6 \\ p = \frac{1}{2} \\ q = 1 - p = \frac{1}{2} \end{cases} \quad (2)$$

The probability of getting exactly k successes in n trials is given by

$$p_X(k) = {}^nC_k p^k q^{n-k} \quad (3)$$

$$= {}^nC_k \left(\frac{1}{2}\right)^k \left(\frac{1}{2}\right)^{n-k} \quad (4)$$

$$= {}^nC_k \left(\frac{1}{2}\right)^6 \quad (5)$$

We know that nC_k can be written as,

$${}^nC_k = \frac{n!}{(n-k)!k!} \quad (6)$$

If pmf is the greatest, then nC_k is the maximum for $k \in [0, n]$, Therefore It can be said that,

$${}^nC_k \geq {}^nC_{k-1} \quad \text{and} \quad (7)$$

$${}^nC_k \geq {}^nC_{k+1} \quad (8)$$

From (6) and (7), we can state that

$$\frac{n!}{(n-k)!k!} \geq \frac{n!}{(n-k+1)!(k-1)!} \quad (9)$$

$$\Rightarrow \frac{n!}{(n-k)!k!} \geq \frac{n!}{(n-k)!k!} \frac{k}{n-k+1} \quad (10)$$

$$\Rightarrow 1 \geq \frac{k}{n-k+1} \quad (11)$$

$$\therefore k \leq \frac{n+1}{2} \quad (12)$$

From (6) and (8), we can state that

$$\frac{n!}{(n-k)!k!} \geq \frac{n!}{(n-k-1)!(k+1)!} \quad (13)$$

$$\Rightarrow \frac{n!}{(n-k)!k!} \geq \frac{n!}{(n-k)!k!} \frac{n-k}{k+1} \quad (14)$$

$$\Rightarrow 1 \geq \frac{n-k}{k+1} \quad (15)$$

$$\therefore k \geq \frac{n-1}{2} \quad (16)$$

From (12) and (16), we can state that

$$\frac{n-1}{2} \leq k \leq \frac{n+1}{2} \quad (17)$$

We know that, $k \in \mathbb{W}$ and $k \in [0, n]$ and from (17),

$$k = \begin{cases} \frac{n}{2}, & \text{if } n \text{ is even} \\ \frac{n+1}{2} \text{ or } \frac{n-1}{2}, & \text{if } n \text{ is odd} \end{cases} \quad (18)$$

As,

$$n = 6 \quad (19)$$

$$\Rightarrow k = \frac{n}{2} = 3 \quad (20)$$

$\therefore X = 3$ is the most likely outcome.

$$p_X(3) = {}^6C_3 \left(\frac{1}{2}\right)^6 \quad (21)$$

$$= \frac{5}{16} \quad (22)$$

The binomial distribution $X \sim \text{Bin}\left(6, \frac{1}{2}\right)$ can be approximated as a Gaussian distribution using the Mean μ and Standard Deviation σ parameters.

$$\mu = np = 6 \times \frac{1}{2} = 3 \quad (23)$$

$$\sigma = \sqrt{npq} = \sqrt{6 \times \frac{1}{2} \times \frac{1}{2}} = \sqrt{\frac{3}{2}} \quad (24)$$

Thus, the Gaussian (normal) approximation is:

$$X \sim \mathcal{N}\left(3, \sqrt{\frac{3}{2}}\right) \quad (25)$$

$$p_X(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} \quad (26)$$

$$= \frac{1}{\sqrt{3\pi}} e^{-\frac{(x-3)^2}{3}} \quad (27)$$

The plots are given as follows:
